

GULFSHORE WELLNESS FEATURED PACKAGE

GLP + LIPO+ Support

A metabolism-focused conversation: appetite signaling, body composition, liver fat processing, cellular energy, and the labs that help make the plan smarter.

GLP pathway education

LIPO+ nutrient support

Labs-first framework

GLP + LIPO+

Pair metabolic medication conversations with nutrient support.

Lauren wanted this package highlighted because it is easy for members to understand: GLP conversations target appetite and metabolic signaling, while LIPO+ nutrients support fat handling and cellular energy pathways.

Important: GLP medications require medical screening and oversight. LIPO+ injections are supportive nutrients, not a replacement for nutrition, training, sleep, labs, or clinician guidance.

Best-fit questions

- ✓ Am I struggling with appetite, cravings, or portion control?
- ✓ Do my labs show glucose, insulin, or liver marker concerns?
- ✓ Am I losing weight but worried about energy and lean mass?
- ✓ Do I have a plan for protein, strength training, and follow-up labs?

What's in LIPO+?

METHIONINE

Liver function + fat processing

An amino acid involved in liver function and fat metabolism. It helps the liver metabolize fats and may help reduce fat buildup in the liver.

INOSITOL

Cell signaling + insulin sensitivity

Supports cell signaling and insulin sensitivity. It plays a role in how the body handles fats and sugars and may support metabolic function.

CHOLINE

Fat transport out of the liver

Important for transporting fats out of the liver. Without enough choline, fat can accumulate in the liver instead of being processed efficiently.

B VITAMINS

Cellular energy pathways

Often B12, B6, and B5. These help convert carbohydrates, fats, and proteins into energy at the cellular level.
